(54) Title: **OIL-SOLUBLE COMPLEXES OF PHOSPHORUS-FREE STRONG MINERAL ACIDS USEFUL AS LUBRICATING OIL ADDITIVES**

(57) Abstract

This invention provides oil-soluble complexes of oil-insoluble phosphorus-free strong mineral acids and alcohols. The complexes are useful antiwear additives in lubricating oils, particularly automatic transmission fluids.

OIL SOLUBLE COMPLEXES OF PHOSPHORUS-FREE STRONG MINERAL
ACIDS USEFUL AS LUBRICATING OIL ADDITIVES

5

BACKGROUND OF THE INVENTION

1. Field of the Invention

This invention concerns oil soluble complexes
10 of phosphorus-free strong mineral acids useful as
additives in lubrication oils, particularly automatic
transmission fluids ("ATF").

15 2. Description of Related Art

It is well known that phosphorus- and sulfur-containing compounds are useful as antiwear additives in lubricating oils. Traditionally these materials are made soluble in oleaginous media by forming reaction products
20 of phosphorus acids and oxides with long chain (C₁₀ to C₂₀) alcohols or amines. Examples of this are shown in U.S. 5,185,090 where short chain (C₂ to C₄) phosphites are transesterified with longer chain alcohols (thioalcohols) and mixtures of alcohols (thioalcohols) to
25 give oil soluble products. Co-pending U.S. application Serial Number 168,840, filed 12/17/93, discloses that P₂O₅ reacted with alcohols (thioalcohols) yield oil soluble products. It is also known that sulfur may be solubilized through reaction with fatty esters or
30 olefins.

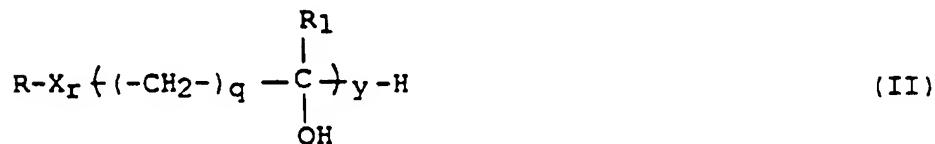

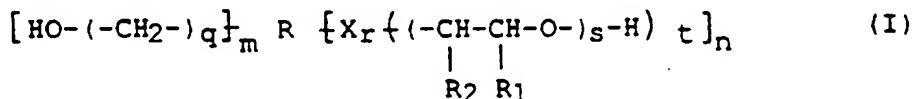

I have now found alternate phosphorus-free antiwear additives which are stable and quite potent. In particular, mineral acids of sulfur such as sulfurous and
35 sulfuric acids can be solubilized by dissolving them at low temperatures in alcohols, particularly in alcohols that contain ether or thioether linkages. Once the alcohol and the acidic material are complexed, the acid remains completely soluble. These non-aqueous solutions

- 2 -

of strong mineral acids allow their addition to lubricating oil additive concentrates or lubricating oils without violent exothermic reactions. The strong antiwear properties of these additives are demonstrated
 5 by FZG load stage failures in the range of 11 to 13.

SUMMARY OF THE INVENTION

10 One embodiment of this invention relates to an oil-soluble additive, wherein the additive comprises the complex of a substantially oil-insoluble phosphorus-free strong mineral acid and an alcohol, the alcohol being a single alcohol or mixtures of alcohols represented by (I)
 15 or (II), where (I) and (II) are:

where:

20 m + n is an integer from 1 to 4;
 m is 0 or an integer from 1 to 4;
 n is 0 or an integer from 1 to 4;
 q is 0 or an integer from 1 to 6;
 R is a C₁-C₅₀ hydrocarbyl group in structure (I),
 25 and is a C₁-C₅₀ hydrocarbyl group or hydrogen
 in structure (II);
 X is sulfur, oxygen, nitrogen, or -CH₂-;
 r is 0, or an integer from 1 to 5 providing
 when X is oxygen or nitrogen, r is 1,
 30 when X is sulfur, r is 1 to 3,

- 3 -

when X is $-\text{CH}_2-$, r is 1 to 5;
s is 0, or an integer from 1 to 12;
t is 0, or an integer from 1 to 2 providing
when X is sulfur, oxygen, or $-\text{CH}_2-$, t is 1,
when X is nitrogen, t is 1 or 2;
5 y is 0, or an integer from 1 to 10; and
 R_1 and R_2 are independently a C_1-C_6 alkyl or
hydrogen.

10 In another embodiment, this invention concerns
a lubricating oil composition comprising a lubrication
oil basestock and an antiwear effective amount of this
invention's additive.

15 A further embodiment of this invention relates
to a method of inhibiting wear in lubricating oil
systems, including power transmission fluid systems, and
particularly automatic transmission fluid systems.

20 Yet another embodiment of this invention
relates to the method of forming the complex.

DETAILED DESCRIPTION OF THE INVENTION

25 Phosphorus-Free Strong Mineral Acids

Suitable phosphorus-free strong mineral acids
include those which are oil-insoluble or substantially
30 oil-insoluble. The term substantially oil-insoluble is
meant to include those acids whose limited solubility
would be improved by following the teachings of this
disclosure.

35 Generally, these strong mineral acids are
classified as acids containing a hydrogen dissociating
moiety having a pKa from about -12 to about 4, preferably

- 4 -

from about -8 to about 3, most preferably from about -4 to about 3. The term pKa is defined as the negative base 10 logarithm of the equilibrium dissociation constant of the acid in an aqueous solution measured at 25 °C. The 5 pKa values reported herein are based on the values reported in "Lange's Handbook of Chemistry", Thirteenth Edition, 1985.

Suitable phosphorus-free mineral acids are 10 chlorosulfonic acid (HOSO_2Cl ; pKa = 10.4), hydrogen bromide (HBr ; pKa = 9.0), hydrogen chloride (HCl ; pKa = 6.1), hydrogen flouride (HF ; pKa = 3.2), hydrogen iodide (HI ; pKa = -9.5), iodic acid (HIO_3 ; pKa = 0.80), nitric acid ($\text{HNO}_3 \cdot 3\text{H}_2\text{O}$; pKa = -1.4), perchloric acid 15 ($\text{HClO}_4 \cdot 3\text{H}_2\text{O}$; pKa = 4.8 and $\text{HClO}_4 \cdot 7\text{H}_2\text{O}$; pKa = -2.1), sulfuric acid (H_2SO_4 ; pKa = 3.0), sulfurous acid (H_2SO_3 ; pKa = 1.9), and trithiocarbonic acid (20°) (H_2CS_3 ; pKa = 2.7). Sulfuric and sulfurous acids are preferred, with sulfuric acid the most preferred.

20

Alcohols:

The alcohols represented by structures I and II form a broad description of alcohols useful in this 25 invention. It should be noted that the hydrocarbyl groups represented by R may be straight-chained, branched, or cyclic. Representative hydrocarbyl groups within this definition include alkyl, alkenyl, cycloalkyl, aralkyl, alkaryl, aryl, and their hetero- 30 containing analogs.

Among the suitable alcohols within structure (I) are alkoxylated alcohols ($s \geq 1$) and alkoxylated polyhydric alcohols ($s \geq 1$ and $m + n + t \geq 2$), and 35 mixtures thereof.

- 5 -

Examples of particularly useful alkoxylated alcohols are nonyl phenol pentaethoxylate, pentapropoxylated butanol, hydroxyethyloctyl sulfide, and diethoxylated dodecyl mercaptan.

5

Examples of particularly useful alkoxylated polyhydric alcohols are oleyl amine tetraethoxylate, 5-hydroxy-3-thio butanol triethoxylate, thiobisethanol, diethoxylated tallow amine, dithiodiglycol, 10 tetrapropoxylated cocoamine, diethylene glycol, and 1,7-dihydroxy - 3,5 - dithioheptane.

Among the suitable alcohols within structure (II) are the polyhydric alcohols ($y \geq 2$). Examples of particularly useful polyhydric alcohols are pentaerythritol, 1-phenyl- 2,3 propane diol, polyvinyl alcohol, 1,2 - dihydroxy hexadecane and 1,3 - dihydroxy octadecane.

20 A particularly useful combination of alcohols within structure I are those represented by (III), (IV), and mixtures thereof, where (III) and (IV) are:

$$25 \quad \text{and} \quad \begin{array}{c} \text{A-OH} \\ | \\ \text{OH-B-OH} \end{array} \quad (\text{IV})$$

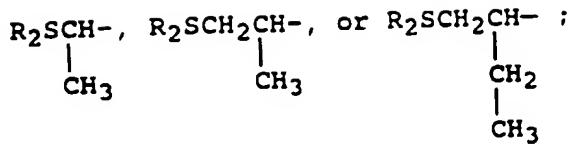

where:

30 $\begin{array}{c} Y_1 \\ | \\ A \text{ is } CH-(OCH_2CH_2)_s- \text{ or } Y_1-CH-(OCH_2CH_2)_s- \\ | \\ X_1 \end{array}$

35 x_1 is H or $R_2SCH_2^-$;

$$Y_1 \text{ is } R_2SCH_2^- \text{, } R_2S\underset{\substack{| \\ CH_3}}{CH}CH_2^- \text{, } R_2S\underset{\substack{| \\ CH_2}}{CH}CH_2^- \text{, }$$

- 6 -

5

s is 0 or an integer from 1-12;

B is $-\text{CH}_2\text{CH}_2\text{SCH}_2\text{CH}_2-$, $-\text{CH}_2\text{CH}_2\text{SSCH}_2\text{CH}_2-$

10

or $R_3\text{CHCH}_2\text{SR}_4-$;

15 and R_2 and R_3 are the same or different and are H or a hydrocarbyl group containing up to 50 carbon atoms. R_4 is a hydrocarbyl group containing up to 50 carbon atoms.

20 The R_2 , R_3 , and R_4 groups of the alcohols (III) and (IV) are hydrocarbyl groups which may be straight-chained, branched, or cyclic. Representative hydrocarbyl groups include alkyl, alkenyl, cycloalkyl, aralkyl, alkaryl, and their hetero-containing analogs.

25 The hetero-containing hydrocarbyl groups may contain one or more hetero atoms. A variety of hetero atoms can be used and are readily apparent to those skilled in the art. Suitable hetero atoms include, but are not limited to, nitrogen, oxygen, phosphorus, and sulfur. Preferred hetero atoms are oxygen and sulfur, 30 with sulfur atoms the most preferred.

When the hydrocarbyl group is alkyl, straight-chained alkyl groups are preferred -- typically those that are about C_2 to C_{18} , preferably about C_4 to C_{12} , 35 most preferably about C_6 to C_{10} alkyl. When the hydrocarbyl group is alkenyl, straight-chained alkenyl groups are preferred -- typically those that are about C_3 to C_{18} , preferably about C_4 to C_{12} , most preferably about C_6 to C_{10} alkenyl. When the hydrocarbyl group is 40 cycloalkyl, the group typically has about 5 to 18 carbon atoms, preferably about 5 to 16, most preferably about 5

- 7 -

to 12. When the hydrocarbyl group is aralkyl and alkaryl, the aryl portion typically contains about C₆ to C₁₂, preferably 6 carbon atoms, and the alkyl portion typically contains about 0 to 18 carbon atoms, preferably 5 to 10.

Straight-chained hydrocarbyl groups are preferred over branched or cyclic groups. However, if the hydrocarbyl group constitutes the less preferred cycloalkyl group, it may be substituted with a C₁ to C₁₈ straight-chained alkyl group, preferably C₂ to C₈.

Representative examples of suitable hydrocarbyl groups for alcohols (III) and (IV) include methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, 2-ethylhexyl, isoctyl, tertiary-octyl, nonyl, isononyl, tertiary-nonyl, secondary-nonyl, decyl, isodecyl, undecyl, dodecyl, tridecyl, palmityl, stearyl, isostearyl, octenyl, nonenyl, decenyl, dodecenyl, oleyl, linoleyl and linolenyl, cyclooctyl, benzyl, octylphenyl, dodecylphenyl, and phenyloctyl.

The preferred hydrocarbyl groups for alcohol (III) are hexyl, octyl, decyl, and dodecyl. The preferred hydrocarbyl groups for alcohol (IV) are, for R₃: methyl, ethyl, and propyl; and, for R₄: methylene, ethylene, propylene, and isopropylene.

Alcohols (III) and (IV) may be prepared by conventional methods widely known in the art. For example, a thioalcohol is produced by oxyalkylation of a mercaptan containing the desired hydrocarbyl group. Suitable oxyalkylating agents include alkylene oxides such as ethylene oxide, propylene oxide, butylene oxide, and mixtures thereof. The most preferred alkylene oxide is ethylene oxide. Thus, the preferred thioalcohol may be prepared by the following reaction equation:

- 8 -

where R is defined above.

5 To produce the desired alcohol, a more preferred reaction route is:

10 wherein R and R₂ are described above. Reaction equation (VI) is preferred because it yields a higher percentage of the desired alcohol whereas reaction equation (V) may produce a single alcohol of the formula RS(CH₂CH₂O⁻)_nH, where n>1, or a mixture of alcohols where n>1 and varies.

15

Complex Formation:

20 The relative proportions of the mineral acid and alcohol in forming the complex may widely vary providing the complex is oil soluble. Thus, the following examples are not intended to limit the relative amounts of mineral acid to alcohol.

25 An example of this invention is illustrated below:

30 where A and B are defined above, and $1 \leq a+2b \leq 6$.

A preferred complex of this invention is formed by a monoalcohol and may be represented by the following equation:

where R is defined above.

- 9 -

Typically, the complexing of mineral acid and alcohol is carried out under atmospheric pressure and at temperatures ranging from about -10 to 65, preferably 20 to 55, most preferably 25 to 40 °C. At these 5 temperatures, a complex is formed without producing water. At temperatures over 65°C water may be produced and this evidences that an etherification reaction has occurred. Products prepared between -10 and 65°C temperatures make it less likely that a reaction will 10 occur. Complexing times range from about 0.5 to about 4 hours. Sufficient complexing can typically be achieved in about two hours.

One method of forming the complex is first to 15 dissolve the appropriate amount of the mineral acid in water. The acid may be purchased as an aqueous concentrate, i.e., 70% in water, thereby eliminating the dissolution step. The alcohols (or thioalcohols) are then added to the aqueous solution of acid and the 20 temperature raised to the desired level with stirring until a homogeneous mixture is produced.

After the mineral acids and alcohols have sufficient time to complex, it may be desirable to remove 25 water, i.e., water that may have been used to dissolve the acid. The water may be removed at atmospheric pressure or the complex may be placed under vacuum to remove water. Stripping times and temperatures vary according to the desired degree of stripping. The vacuum 30 can range from about -65 to about -90 kPa, stripping times from about 1 to about 2 hours, and temperatures from 50 to 65 °C. Typically, sufficient water removal may be achieved at a vacuum of about -60 kPa which is maintained for about 1 hour at 55 °C.

35

A second method of forming a stable complex is to dissolve the anhydrous acid in the alcohol mixture.

- 10 -

It is sometimes desirable to then add a small amount of water to the blend. Typically, 1-5 weight percent of water will give a stable homogeneous material.

5 The complexes shown in equations (VI) and (VII) may be added to a lubricating oil basestock in an amount sufficient to impart antiwear properties. The typical range is 0.05 to 2.0 weight percent of 100% active ingredient, preferably 0.2 to 1.0 weight percent, most 10 preferably 0.4 to 0.7 weight percent.

15 It may be desirable to include a source of boron with the complex of this invention in the lubrication oil basestock. The presence of boron tends to lessen the deterioration of silicone-based seals. The 20 boron source may be present in the form of borated dispersants, borated amines, borated alcohols, borated esters, or alkyl borates.

25 Accordingly, by adding an effective amount of this invention's complex to a lubricating oil and then placing the resulting lubrication oil within a lubrication system, the oil will inhibit wear in metal-to-metal contact as well as in metal-to-nonmetal contact (i.e., nonmetal composites: paper/phenolic resins, graphite/paper/phenolic resins, KEVLAR®/paper resins, etc.).

30 The lubrication oil basestock may contain one or more additives to form a fully formulated lubricating oil. Such lubricating oil additives include corrosion inhibitors, detergents, pour point depressants, antioxidants, extreme pressure additives, viscosity improvers, friction modifiers, and the like. These 35 additives are typically disclosed in, for example, "Lubricant Additives" by C. V. Smalheer and R. Kennedy Smith, 1967, pp. 1-11 and in U.S. Patent 4,105,571, the

- 11 -

disclosures of which are incorporated herein by reference. A fully formulated lubricating oil normally contains from about 1 to about 20 weight % of these additives. Borated or unborated dispersants may also be 5 included as additives in the oil, if desired. However, the precise additives used (and their relative amounts) will depend upon the particular application of the oil. Contemplated applications for formulations of this 10 invention include passenger car motor oils, gear oils, industrial oils, lubricating oils, and power transmission fluids, especially automatic transmission fluids and tractor hydraulic fluids. The following list shows representative amounts of additives in lubrication oil 15 formulations:

15

	<u>Additive</u>	(Broad) Wt. %	(Preferred) Wt. %
20	VI Improvers	1 - 12	1 - 4
25	Corrosion Inhibitor/ Passivators	0.01 - 3	0.01 - 1.5
30	Anti-Oxidants	0.01 - 5	0.01 - 1.5
35	Dispersants	0.10 - 10	0.1 - 8
40	Anti-Foaming Agents	0.001- 5	0.001- 1.5
	Detergents	0.01 - 6	0.01 - 3
	Anti-Wear Agents	0.001- 5	0.001- 1.5
	Pour Point Depressants	0.01 - 2	0.01 - 1.5
	Seal Swellants	0.1 - 8	0.1 - 6
	Friction Modifiers	0.01 - 3	0.01 - 1.5
	Lubricating Base Oil	Balance	Balance

Particularly suitable detergent additives for use with this invention include ash-producing basic salts of Group I (alkali) or Group II (alkaline) earth metals

- 12 -

and transition metals with sulfonic acids, carboxylic acids, or organic phosphorus acids.

Particularly suitable types of antioxidant for
5 use in conjunction with the complex of this invention are
the amine-containing and hydroxy aromatic-containing
antioxidants. Preferred types of these antioxidants are
alkylated diphenyl amines and substituted 2,6 di-t-butyl
phenols.

10 The complex of this invention may also be
blended to form a concentrate. A concentrate will
generally contain a major portion of the complex together
with other desired additives and a minor amount of
15 lubrication oil or other solvent. The complex and
desired additives (i.e., active ingredients) are provided
in the concentrate in specific amounts to give a desired
concentration in a finished formulation when combined
with a predetermined amount of lubrication oil. The
20 collective amounts of active ingredient in the
concentrate typically are from about 0.2 to 50,
preferably from about 0.5 to 20, most preferably from 2
to 20 weight % of the concentrate, with the remainder
being a lubrication oil basestock or a solvent.

25 The complex of this invention may interact with
the amines contained in the formulation (i.e.,
dispersant, friction modifier, and antioxidant) to form
quaternary ammonium salts. The formation of amine and
30 quaternary ammonium salts, however, will not greatly
affect the antiwear characteristics of this invention.

Suitable lubrication oil basestocks can be
derived from natural lubricating oils, synthetic
35 lubricating oils, or mixtures thereof. In general, the
lubricating oil basestock will have a viscosity in the
range of about 5 to about 10,000 mm²/s (cSt) at 40°C,

- 13 -

although typical applications will require an oil having a viscosity ranging from about 10 to about 1,000 mm²/s (cSt) at 40°C.

5 Natural lubricating oils include animal oils, vegetable oils (e.g., castor oil and lard oil), petroleum oils, mineral oils, and oils derived from coal or shale.

Synthetic oils include hydrocarbon oils and
10 halo-substituted hydrocarbon oils such as polymerized and interpolymerized olefins (e.g., polybutylenes, polypropylenes, propylene-isobutylene copolymers, chlorinated polybutylenes, poly(1-hexenes), poly(1-octenes), poly(1-decenes), etc., and mixtures thereof);
15 alkylbenzenes (e.g., dodecylbenzenes, tetradecylbenzenes, dinonylbenzenes, di(2-ethylhexyl)benzene, etc.); polyphenyls (e.g., biphenyls, terphenyls, alkylated polyphenyls, etc.); alkylated diphenyl ethers, alkylated diphenyl sulfides, as well as their derivatives, analogs,
20 and homologs thereof; and the like.

Synthetic lubricating oils also include
alkylene oxide polymers, interpolymers, copolymers, and
their derivatives where the terminal hydroxyl groups have
25 been modified by esterification, etherification, etc. This class of synthetic oils is exemplified by polymerization of ethylene oxide or propylene oxide; the alkyl and aryl ethers of these polyoxyalkylene polymers (e.g., methyl-polyisopropylene glycol ether having an average molecular weight of 1000, diphenyl ether of polyethylene glycol having a molecular weight of 500-1000, diethyl ether of polypropylene glycol having a molecular weight of 1000-1500); and mono- and poly-carboxylic esters thereof
30 (e.g., the acetic acid esters, mixed C₃-C₈ fatty acid esters, and C₁₃ oxo acid diester of tetraethylene glycol).

- 14 -

Another suitable class of synthetic lubricating oils comprises the esters of dicarboxylic acids (e.g., phthalic acid, succinic acid, alkyl succinic acids and 5 alkenyl succinic acids, maleic acid, azelaic acid, suberic acid, sebasic acid, fumaric acid, adipic acid, linoleic acid dimer, malonic acid, alkylmalonic acids, alkenyl malonic acids, etc.) with a variety of alcohols (e.g., butyl alcohol, hexyl alcohol, dodecyl alcohol, 2-10 ethylhexyl alcohol, ethylene glycol, di-ethylene glycol monoether, propylene glycol, etc.). Specific examples of these esters include dibutyl adipate, di(2-ethylhexyl) sebacate, di-n-hexyl fumarate, dioctyl sebacate, diisooctyl azelate, diisodecyl azelate, dioctyl 15 phthalate, didecyl phthalate, dieicosyl sebacate, the 2-ethylhexyl diester of linoleic acid dimer, and the complex ester formed by reacting one mole of sebacic acid with two moles of tetraethylene glycol and two moles of 2-ethylhexanoic acid, and the like.

20 Esters useful as synthetic oils also include those made from C₅ to C₁₂ monocarboxylic acids and polyols and polyol ethers such as neopentyl glycol, trimethylolpropane, pentaerythritol, dipentaerythritol, 25 tripentaerythritol, and the like. Synthetic hydrocarbon oils are also obtained from hydrogenated oligomers of normal olefins.

Silicone-based oils (such as the polyalkyl-, 30 polyaryl-, polyalkoxy-, or polyaryloxy-siloxane oils and silicate oils) comprise another useful class of synthetic lubricating oils. These oils include tetraethyl silicate, tetraisopropyl silicate, tetra-(2-ethylhexyl) silicate, tetra-(4-methyl-2-ethylhexyl) silicate, 35 tetra(p-tert-butylphenyl) silicate, hex-(4-methyl-2-pentoxy)-disiloxane, poly(methyl)-siloxanes and poly(methylphenyl) siloxanes, and the like. Other

- 15 -

synthetic lubricating oils include liquid esters of phosphorus-containing acids (e.g., tricresyl phosphate, trioctyl phosphate, and diethyl ester of decylphosphonic acid), polymeric tetrahydroforans, polyalphaolefins, and 5 the like.

The lubricating oil may be derived from unrefined, refined, rerefining oils, or mixtures thereof. Unrefined oils are obtained directly from a natural 10 source or synthetic source (e.g., coal, shale, or tar sands bitumen) without further purification or treatment. Examples of unrefined oils include a shale oil obtained directly from a retorting operation, a petroleum oil obtained directly from distillation, or an ester obtained 15 directly from an esterification process, each of which is then used without further treatment. Refined oils are similar to the unrefined oils except that refined oils have been treated in one or more purification steps to improve one or more properties. Suitable purification 20 techniques include distillation, hydrotreating, dewaxing, solvent extraction, acid or base extraction, filtration, and percolation, all of which are known to those skilled in the art. Rerefining oils are obtained by treating refined oils in processes similar to those used to obtain 25 the refined oils. These rerefining oils are also known as reclaimed or reprocessed oils and often are additionally processed by techniques for removal of spent additives and oil breakdown products.

30 This invention may be further understood by reference to the following examples which are not intended to restrict the scope of the appended claims.

- 16 -

PREPARATIVE EXAMPLES

EXAMPLE 1:

5 In a one liter flask equipped with a stirrer, water condenser, thermometer, an addition funnel and a dry ice trap 190 g (1 mole) of octylthioethanol and 122 g (1 mole) of thiobisethanol were placed. The mixture of alcohols was cooled to near 0 °C and 98 g (1 mole) of
10 H_2SO_4 is added dropwise. After the addition is completed, the mixture was stirred for approximately 1 hour. A homogeneous clear liquid was obtained containing approximately 23.7% S.

15 EXAMPLE 2:

In a one liter flask equipped with a stirrer, water condenser, thermometer, an addition funnel and a dry ice trap 380 g (2 moles) of octylthioethanol and 122 g (1 mole) of thiobisethanol were placed. The mixture of alcohols was cooled to near 0 °C and 98 g (1 mole) of
20 H_2SO_4 was added dropwise. After the addition is completed, the mixture was stirred for approximately 1 hour. A homogeneous clear liquid was obtained containing
25 approximately 21.5% S.

EXAMPLE 3:

In a one liter flask equipped with a stirrer, water condenser, thermometer, an addition funnel and a dry ice trap 190 g (1 mole) of octylthioethanol and 154 g (1 mole) of dithiodiglycol were placed. The mixture of alcohols was cooled to near 0 °C and 98 g (1 mole) of
30 H_2SO_4 was added dropwise. After the addition was complete, the mixture was stirred for approximately one
35 hour. A homogeneous clear liquid was obtained containing approximately 29.3% S.

- 17 -

The stability of the samples of Examples 1 to 3 was assessed by examining the samples stored at room temperature for at least 90 days. All samples remained
5 clear with no separation evident.

PERFORMANCE EXAMPLES

10 The antiwear performance of the additives of this invention is illustrated by the following examples.

15 Three mineral oil formulations, A-C, containing the additives of Examples 1-3, respectively, were prepared. Two comparative fluids, D and E, were used. Formulation D was a "blank" ATF formulation containing no antiwear additive while E was the reference base oil used in all the formulations.

20 Formulations A-D were prepared using the same lubrication oil basestock, E, and the same amounts of dispersant, antioxidant, friction modifier, seal swellant, antifoamant, and viscosity modifier. The amounts of these additives remained the same for 25 Formulations A-D so that the effect of this invention's additives could be quantified in each formulation.

Formulations A-E were run in the FZG Gear Test, according to the DIN 51354 (Germany) test procedure.
30 Accordingly, the gear set was run using each tests formulation at increasing load stages until scoring of the tooth flank occurred. Therefore, failure of a formulation at higher load stages is desirable. Results of this test are:

- 18 -

FZG GEAR TEST

<u>F¹</u>	<u>Nonphosphorus-Containing Additive</u>	% By Wt. ²	Stage Failure
A	EXAMPLE 1	0.5	11
B	EXAMPLE 2	0.5	12
C	EXAMPLE 3	0.5	13 ³
D	None - BLANK ATF	--	7
E	None - BASE OIL	--	5

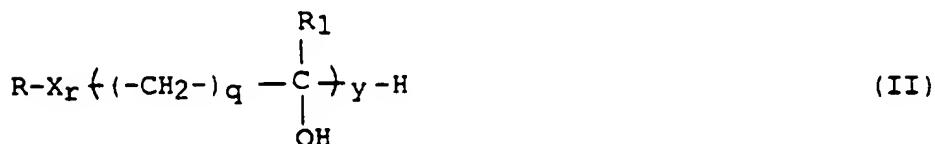

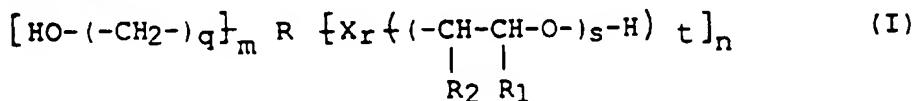

1- F = Formulation.
 5 2- Weight percent of total formulation.
 3- Maximum load stage possible.

The results of this test indicate that the formulations containing the additives of this invention gave better results than Formulation D, the blank ATF, and Formulation E, the base oil. More importantly, the results of this test illustrate that the additives of this invention are capable of providing potent antiwear performance in the absence of phosphorus as evidenced by the high FZG load stages measured.

CLAIMS:

1. An oil-soluble additive wherein the additive comprises the complex of a substantially oil-insoluble phosphorus-free strong mineral acid and an alcohol, the alcohol being a single alcohol or mixtures of alcohols represented by (I) or (II), where (I) and (II) are:

where:

$m + n$ is an integer from 1 to 4;
 m is 0 or an integer from 1 to 4;
 n is 0 or an integer from 1 to 4;
 q is 0 or an integer from 1 to 6;
 R is a C_1-C_{50} hydrocarbyl group in structure (I),
and is a C_1-C_{50} hydrocarbyl group or hydrogen
in structure (II);
 X is sulfur, oxygen, nitrogen, or $-\text{CH}_2-$;
 r is 0, or an integer from 1 to 5 providing
when X is oxygen or nitrogen, r is 1,
when X is sulfur, r is 1 to 3,
when X is $-\text{CH}_2-$, r is 1 to 5;
 s is 0, or an integer from 1 to 12;
 t is 0, or an integer from 1 to 2 providing
when X is sulfur, oxygen, or $-\text{CH}_2-$, t is 1,
when X is nitrogen, t is 1 or 2;
 y is 0, or an integer from 1 to 10; and
 R_1 and R_2 are independently a C_1-C_6 alkyl or
hydrogen.

- 20 -

2. The additive of claim 1, wherein the strong mineral acid has a pKa from about -12 to about 4 in aqueous solutions measured at 25 °C.

3. The additive of claim 2, wherein the strong mineral acid is H₂SO₃ or H₂SO₄.

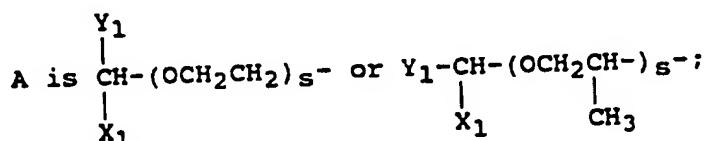

4. The additive of claim 3, wherein the alcohol selected from the group consisting of (III), (IV), and mixtures thereof, where (III) and (IV) are:

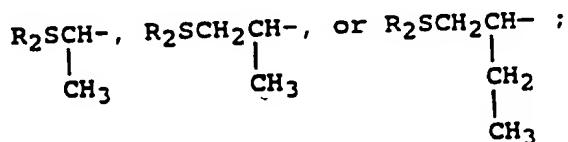

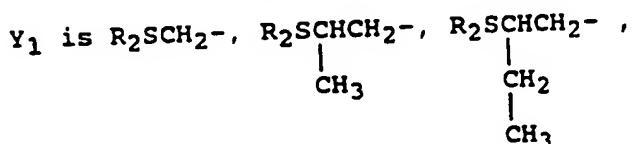

and

where:

X₁ is H or R₂SCH₂⁻;

s is 0 or an integer from 1-12;

B is -CH₂CH₂SCH₂CH₂⁻, -CH₂CH₂SSCH₂CH₂⁻

or R₃CHCH₂SR₄⁻;

where R₂ and R₃ are the same or different and are H or a hydrocarbyl group containing up to 50 carbon atoms; and

- 21 -

R₄ is a hydrocarbyl group containing up to 50 carbon atoms.

5. The additive of claim 4 where (III) and (IV) are mixed with the acid in the molar ratio of alcohol to acid of 1:1 to 6:1, and the amount of (III) is at least twice the amount of (IV).

6. The additive of claim 5, where R₂, R₃, and R₄ represent alkyl, alkenyl, cycloalkyl, aralkyl, or alkaryl.

7. The additive of claim 6, where A is R₂SCH₂CH₂-, R₂ is a C₁-C₁₅ alkyl.

8. A lubricating oil composition comprising a major amount of lubricating oil basestock and an antiwear effective amount of the complex formed in claim 1.

9. A concentrate composition comprising the complex of claim 1.

10. A method of forming the complex of claim 1, wherein the acid and alcohol are mixed at a temperature from about -10°C to 65°C.

A. CLASSIFICATION OF SUBJECT MATTER

IPC 6 C10M141/00 C10M161/00 C10M159/12 // (C10M141/00, 125:18, 125:22, 129:06, 129:08, 135:24), (C10M161/00, 125:18, 125:22, 145:36),
C10N30:06, C10N70:00

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6 C10M

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US,A,4 764 299 (M.F.SALOMON) 16 August 1988 see column 4, line 17 - line 42 ----	1-8
X	US,A,5 338 470 (J.HIEBERT) 16 August 1994 see column 5, line 8 - line 11; example 1 -----	1-3,8

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents :

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubt on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

T later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

X document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

Y document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
